# PROJECT OVERVIEW

An AI platform designed to bridge the gap between job seekers and target technical roles through automated analysis, match scoring, personalized learning plans, and interview preparation.

**Key Workflow:**

- Upload a resume (PDF) and select a target job title.
- An advanced cooperating AI agent pipeline analyzes the resume and evaluates role requirements.
- Delivers a tailored package including match scores, learning roadmaps or application-ready guides, resume improvements, and interview questions.

# SYSTEM ARCHITECTURE

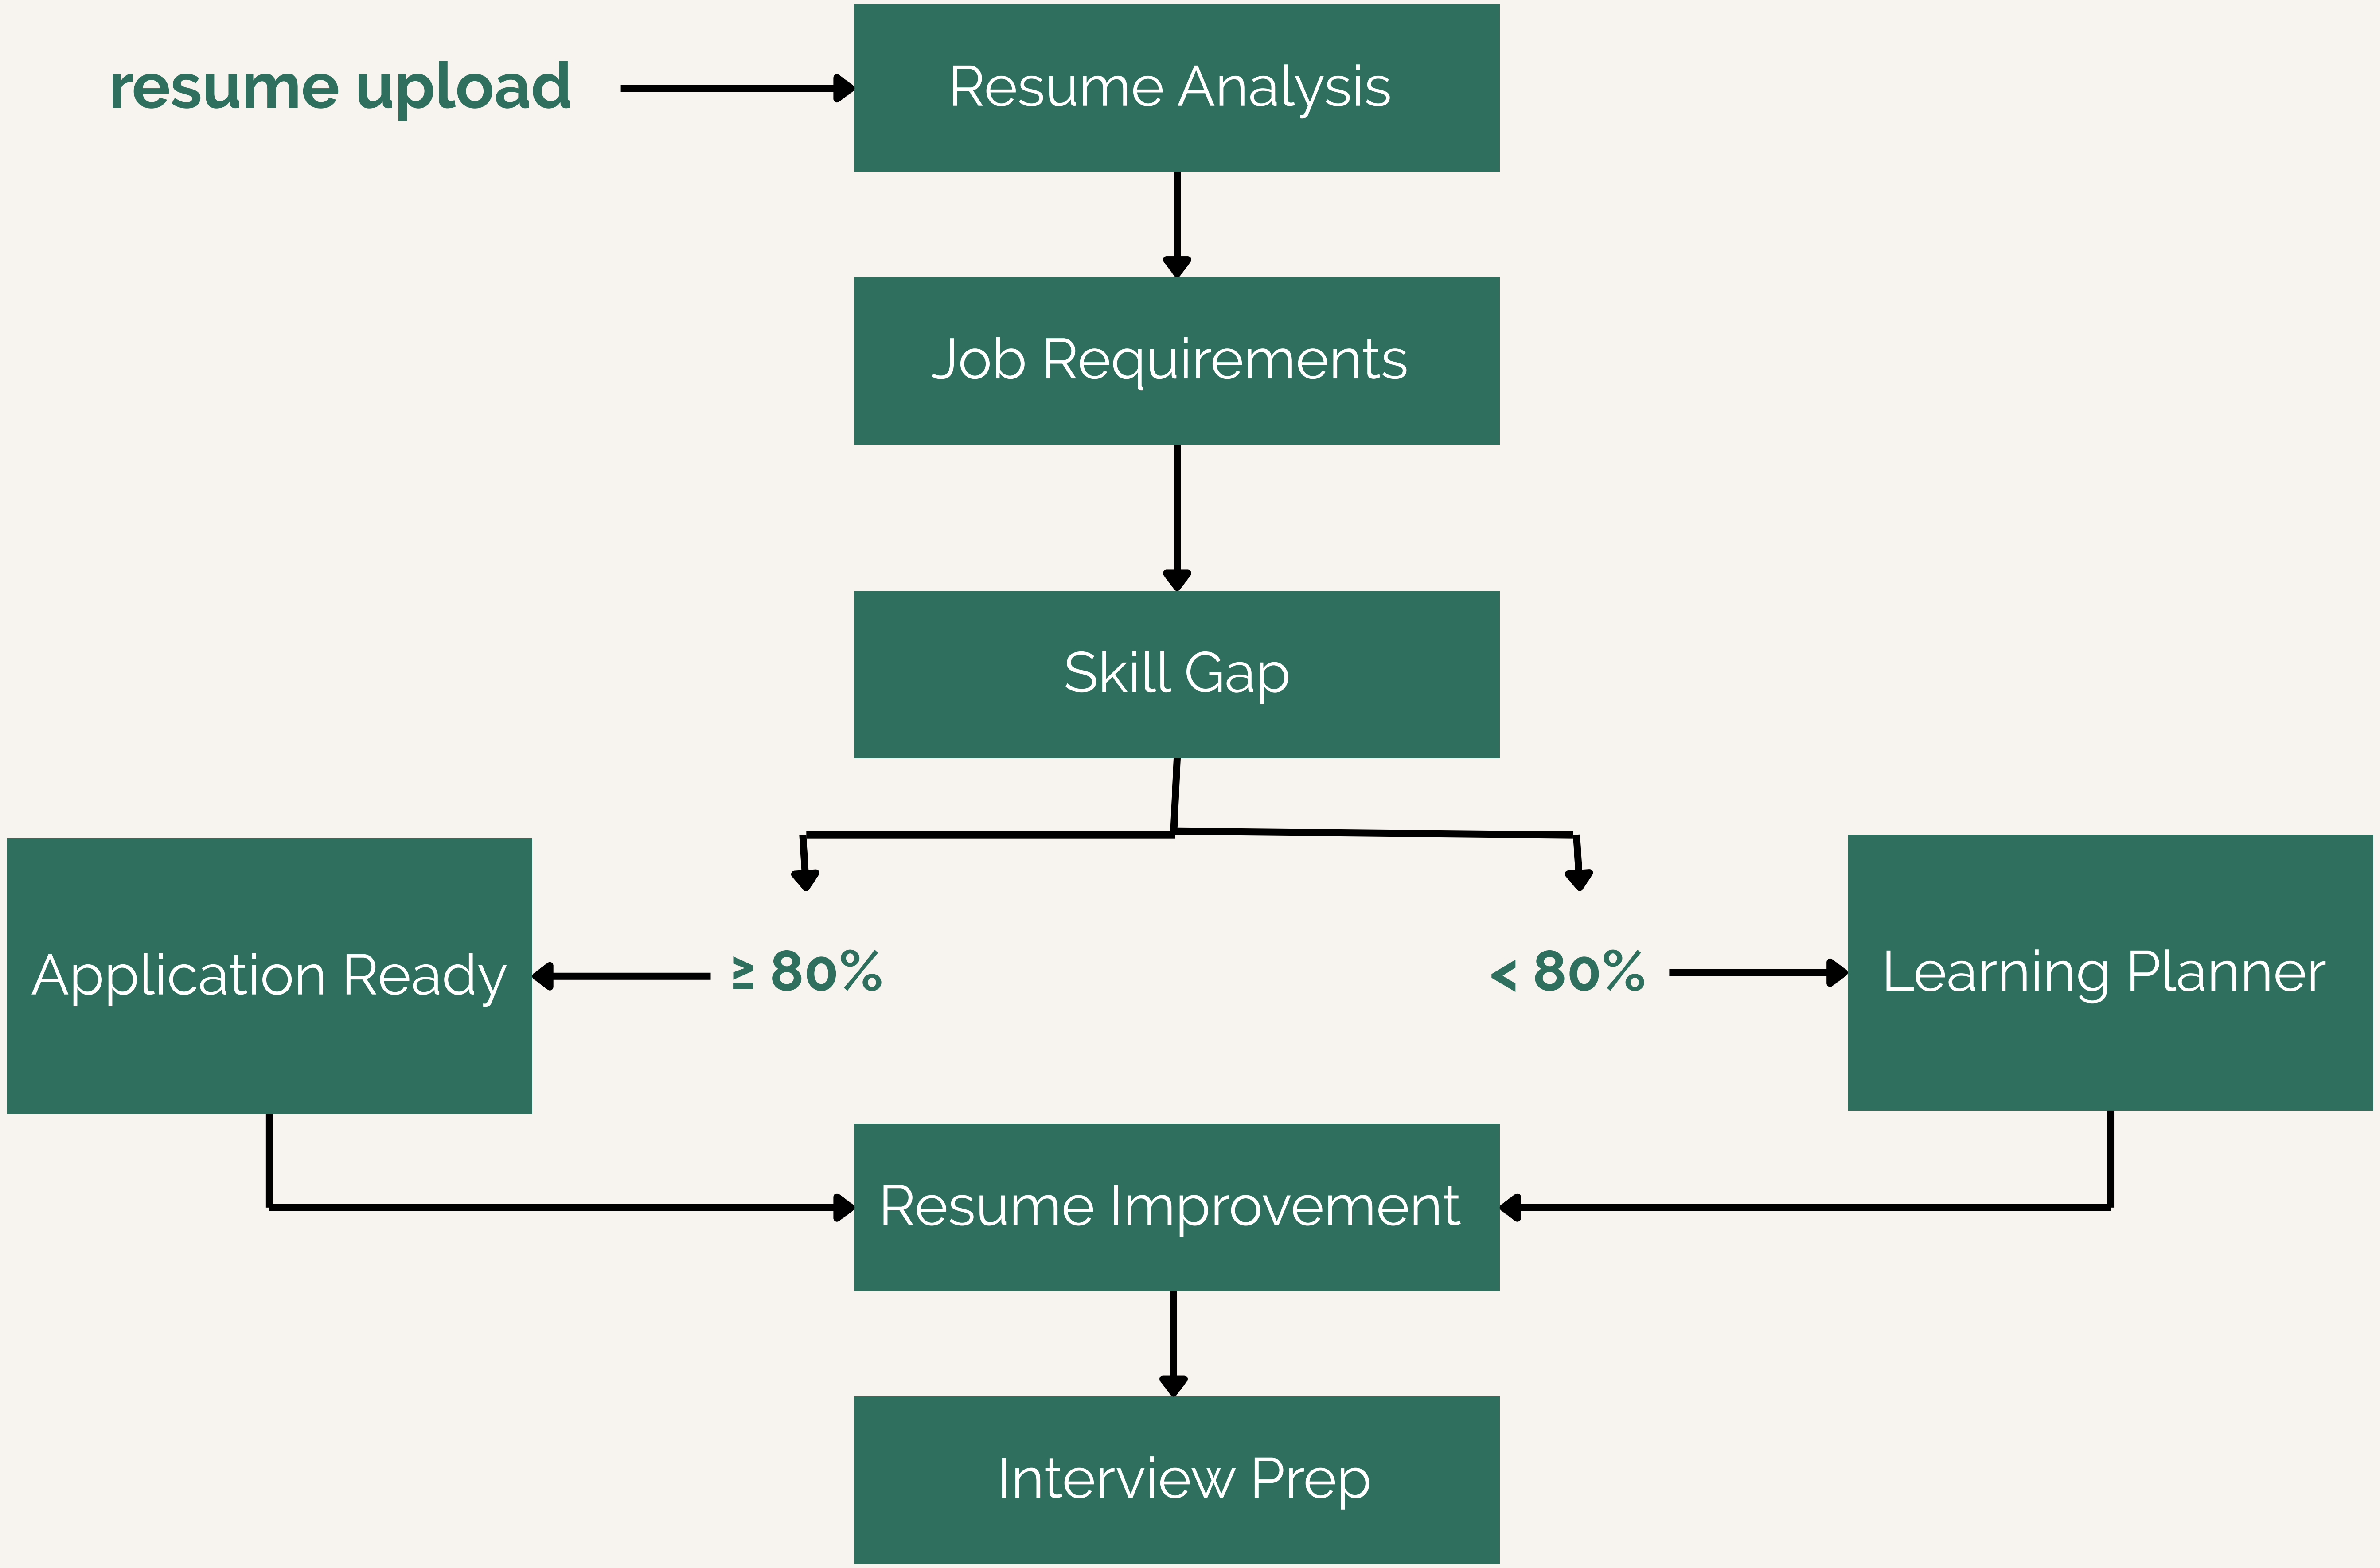
LAYER 4: FRONTEND LAYER (HTML / CSS / JS UI)

LAYER 3: API GATEWAY LAYER (FASTAPI, REST ENDPOINTS, CORS)

LAYER 2: STORAGE & SECURITY (SQLITE, SQLALCHEMY, AUTH)

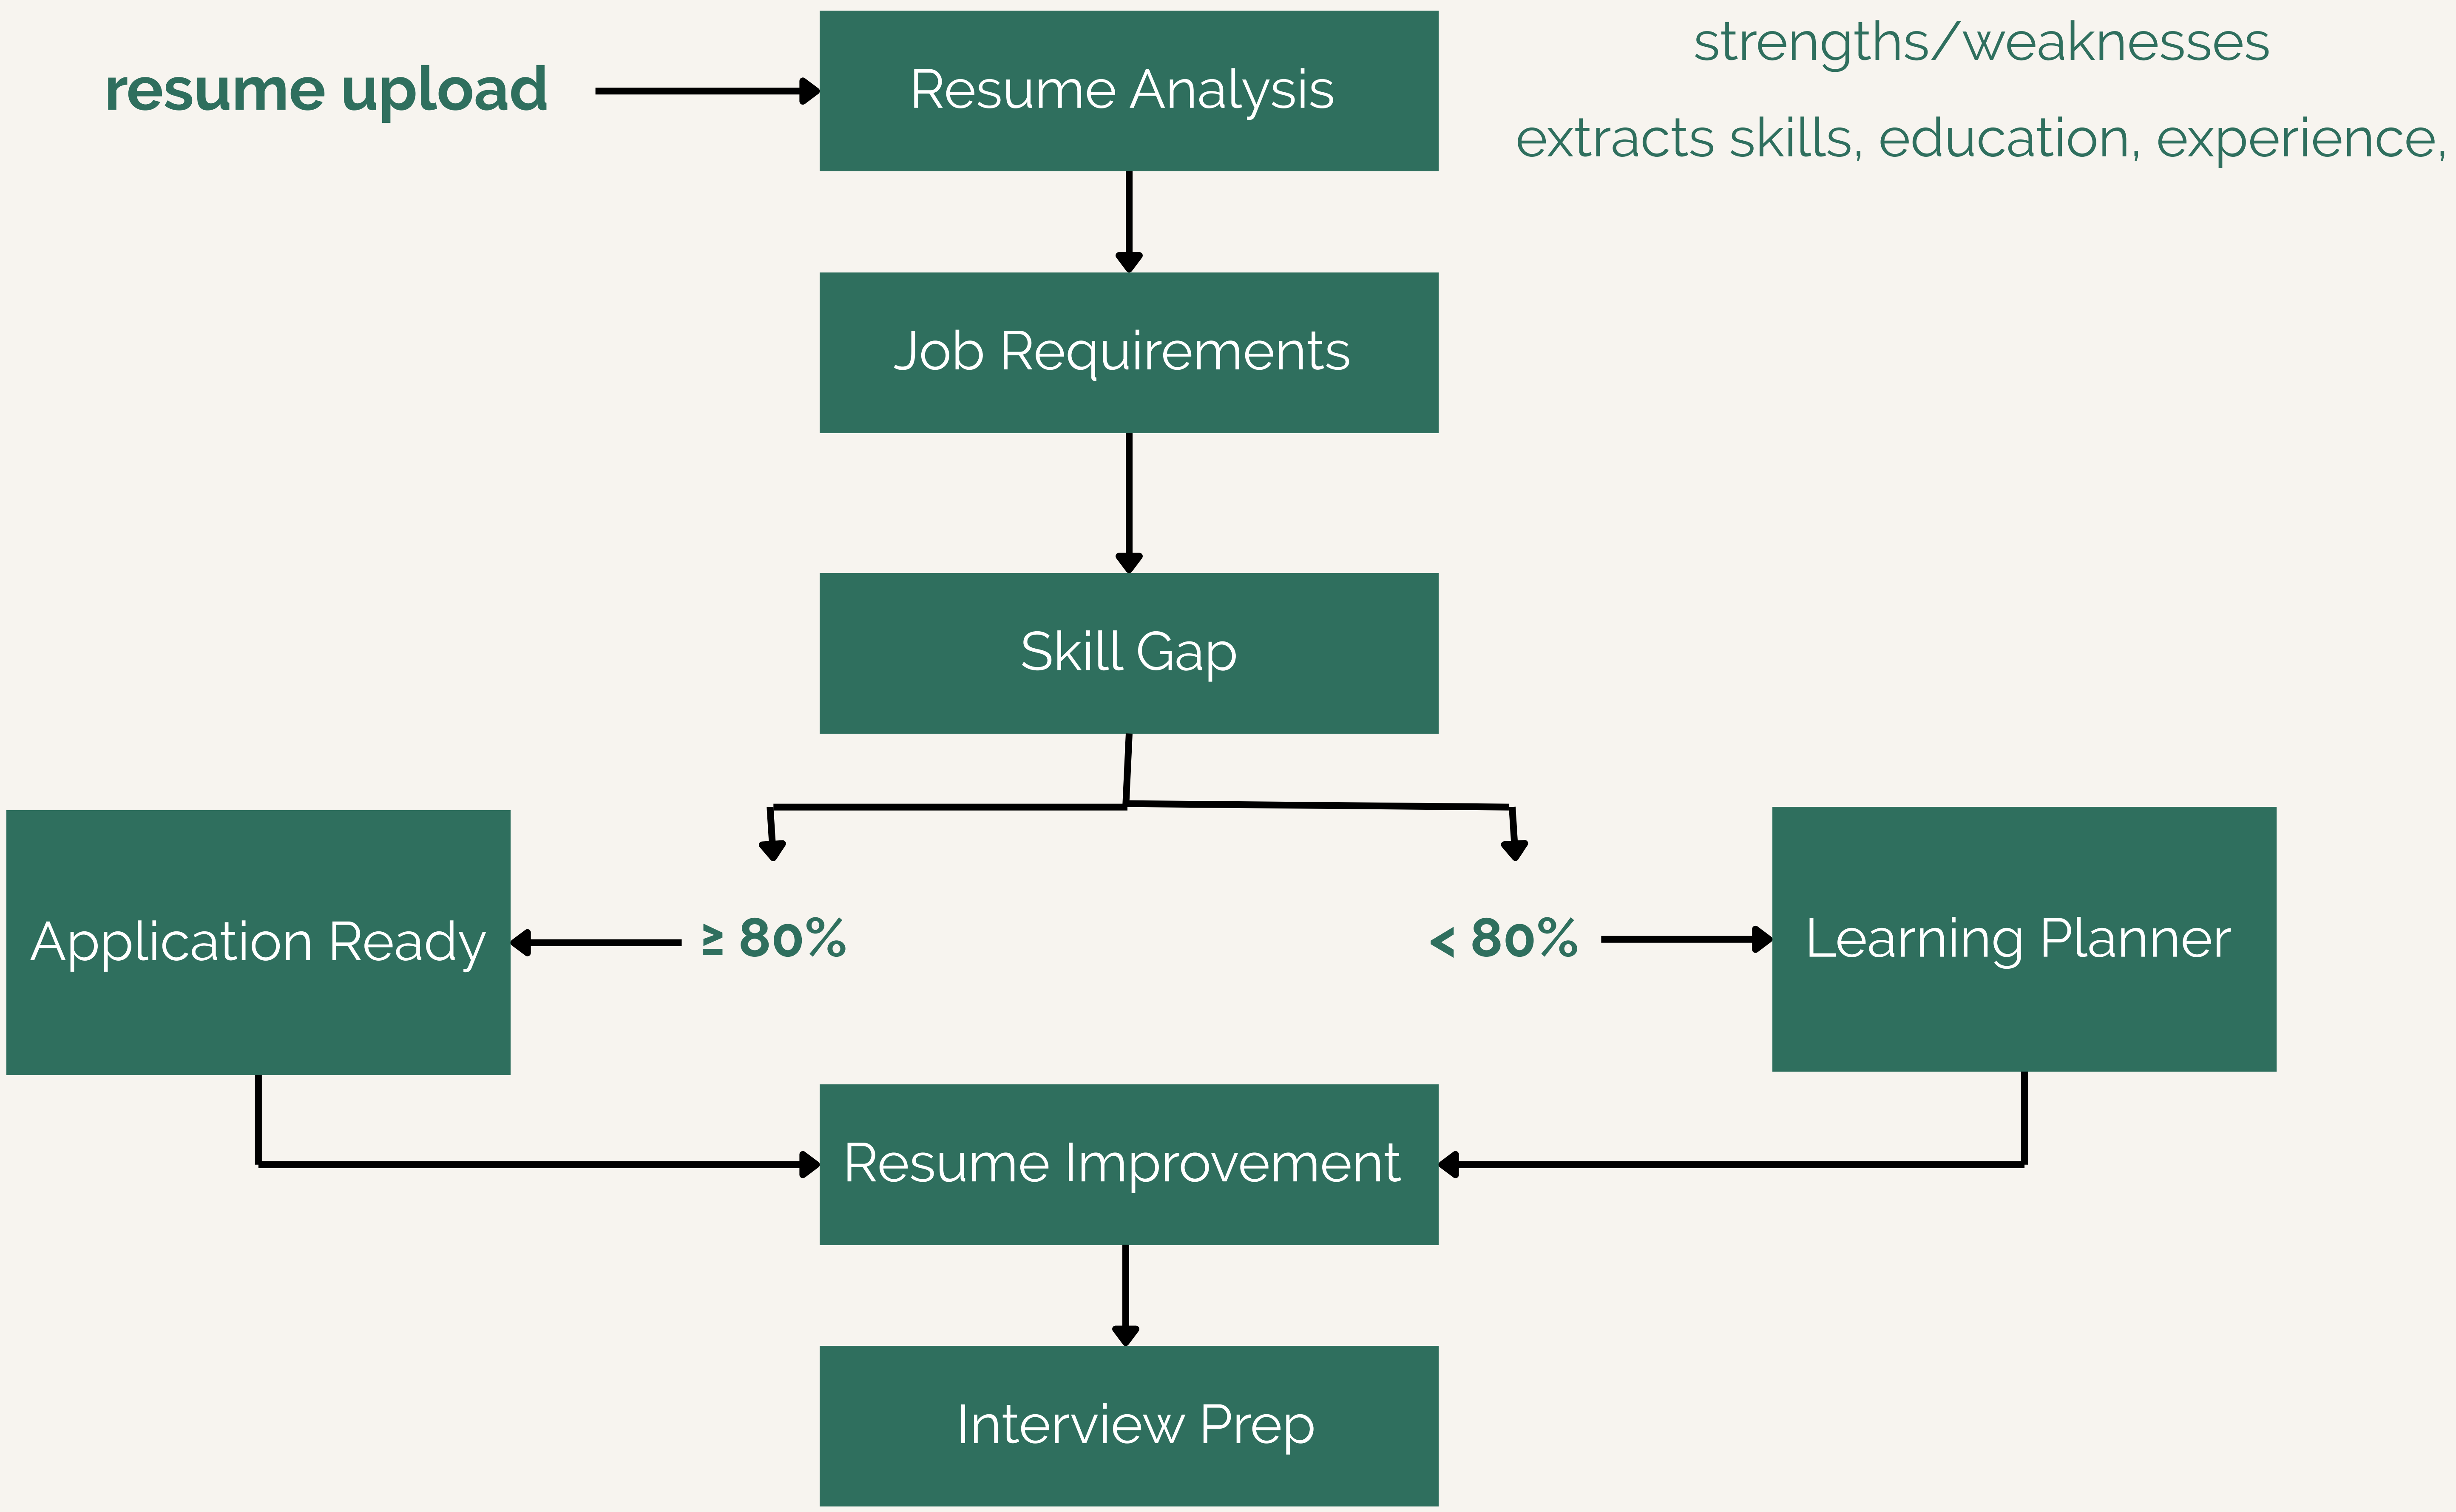
LAYER 1: AI AGENT LAYER (LANGGRAPH MULTI-AGENTS)

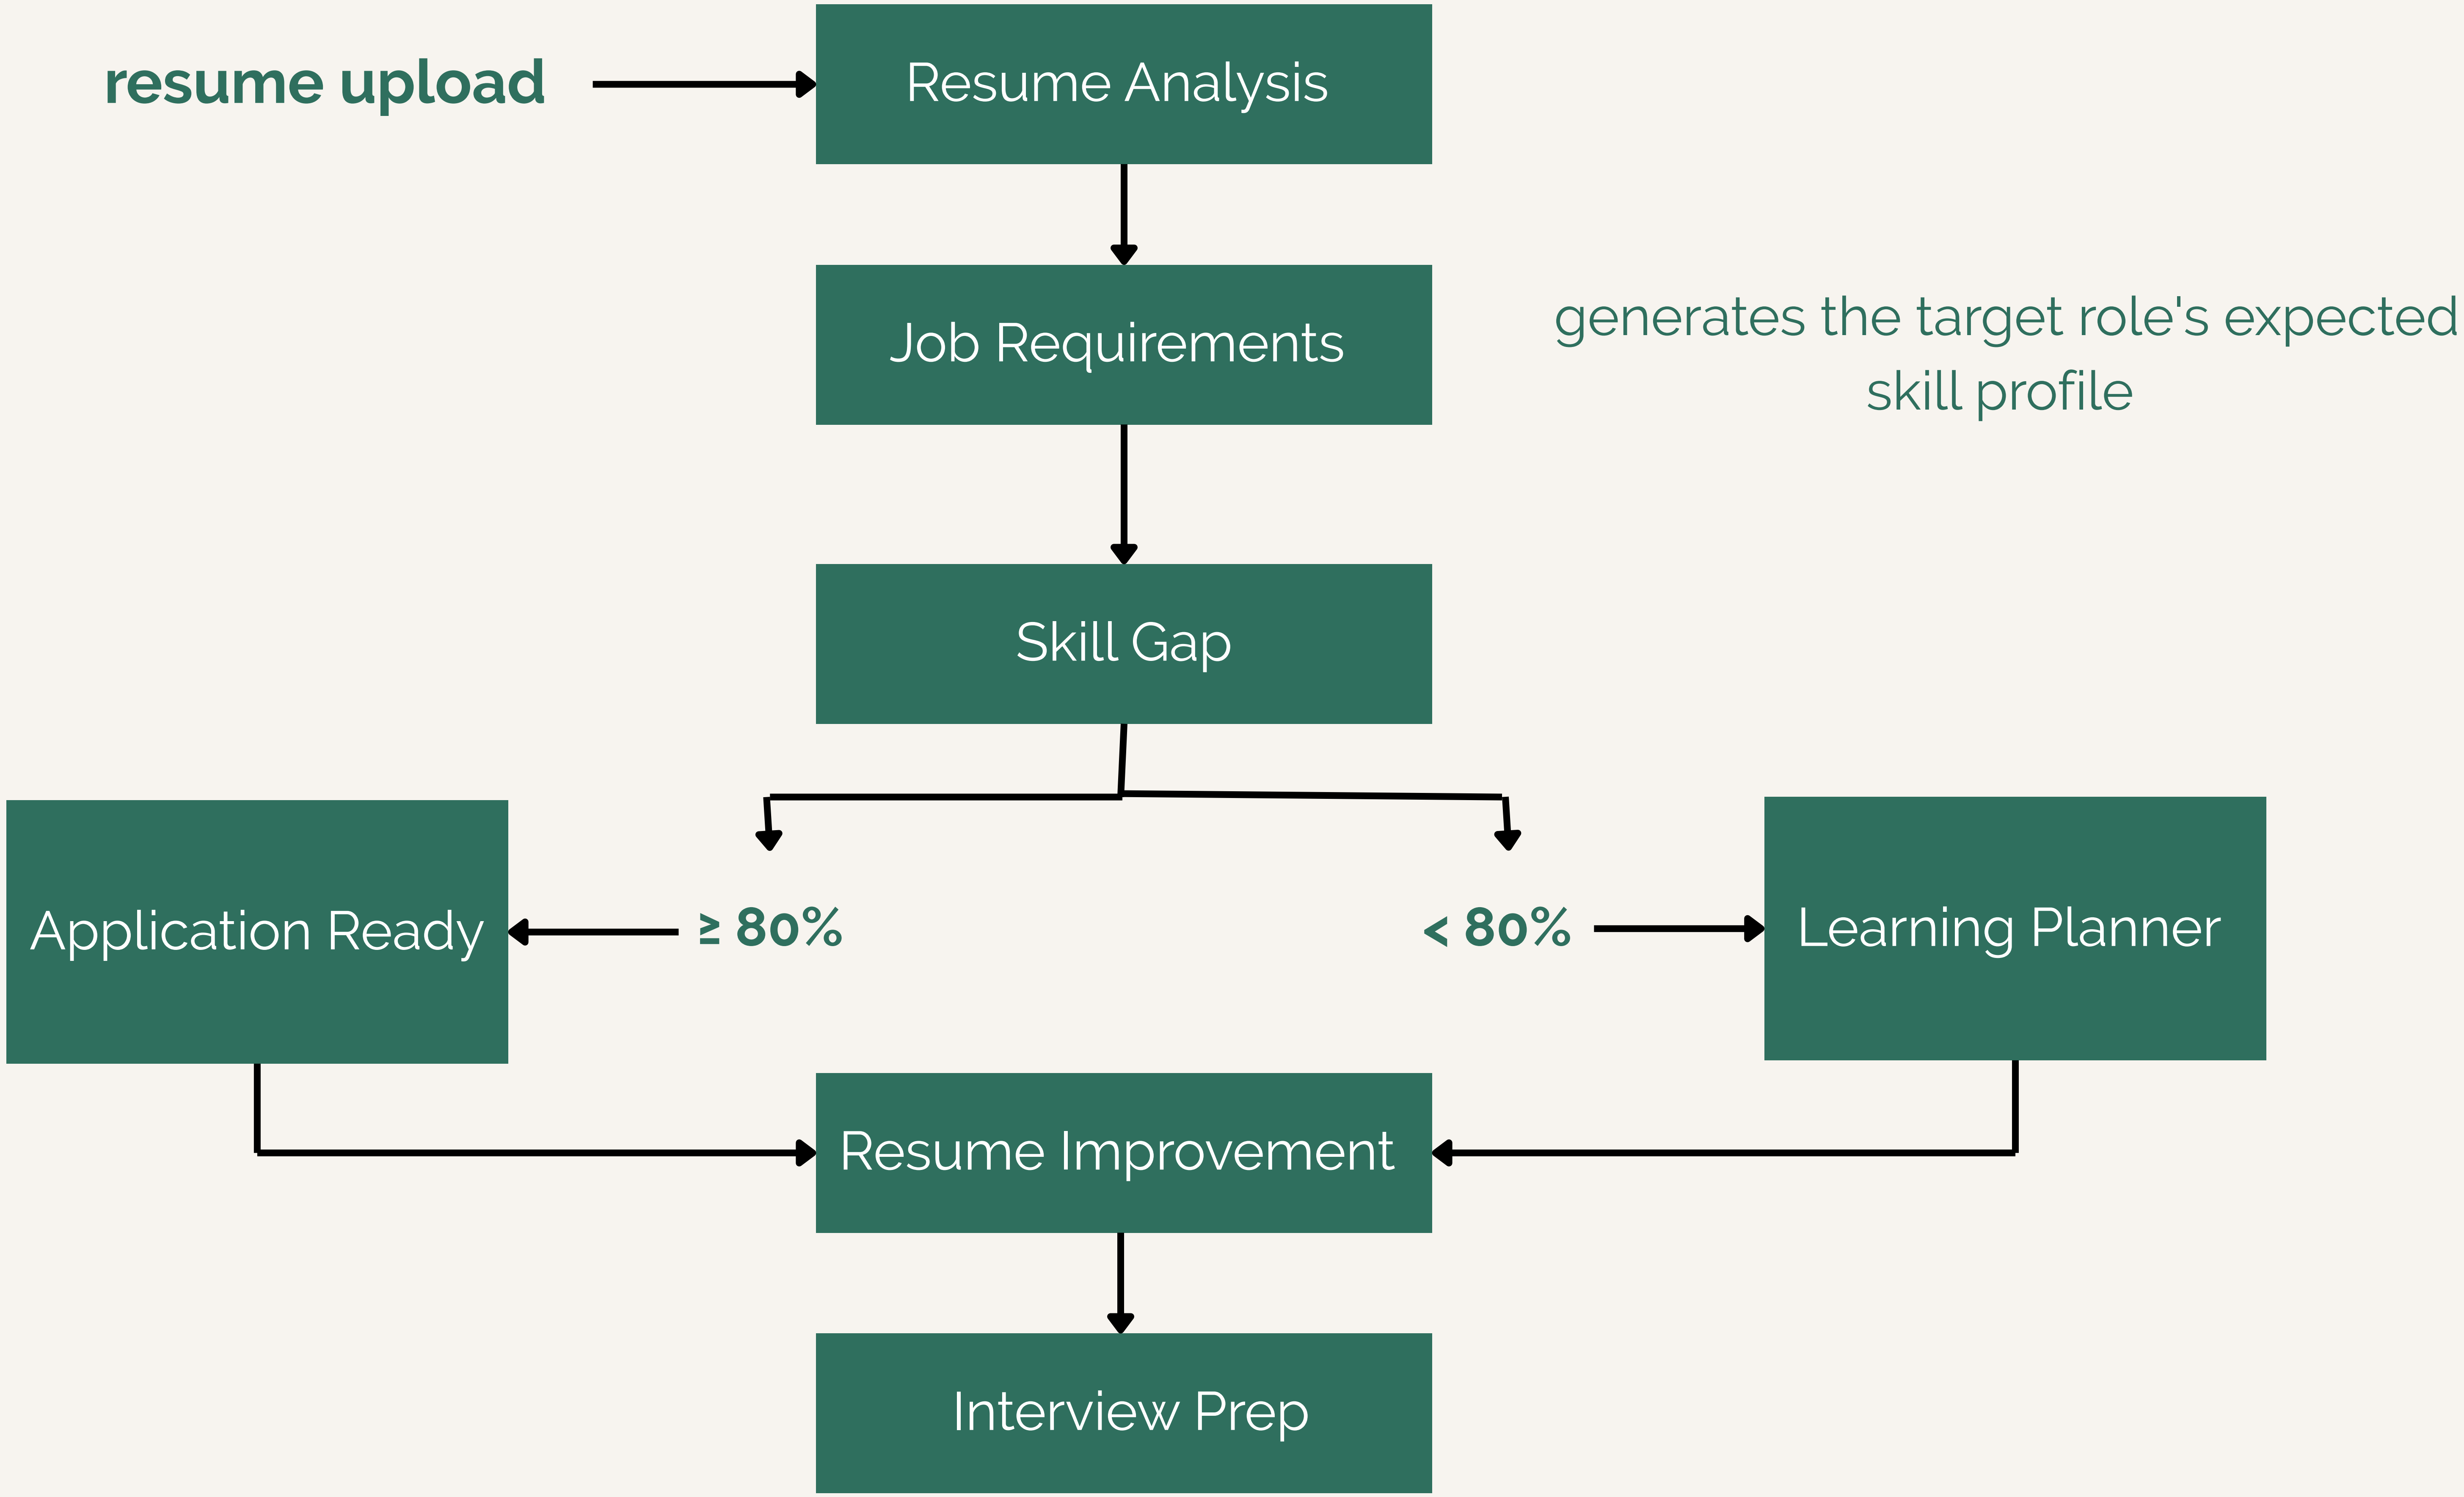
LAYER 0: CORE LLM (QWEN2.5:7B VIA OLLAMA)



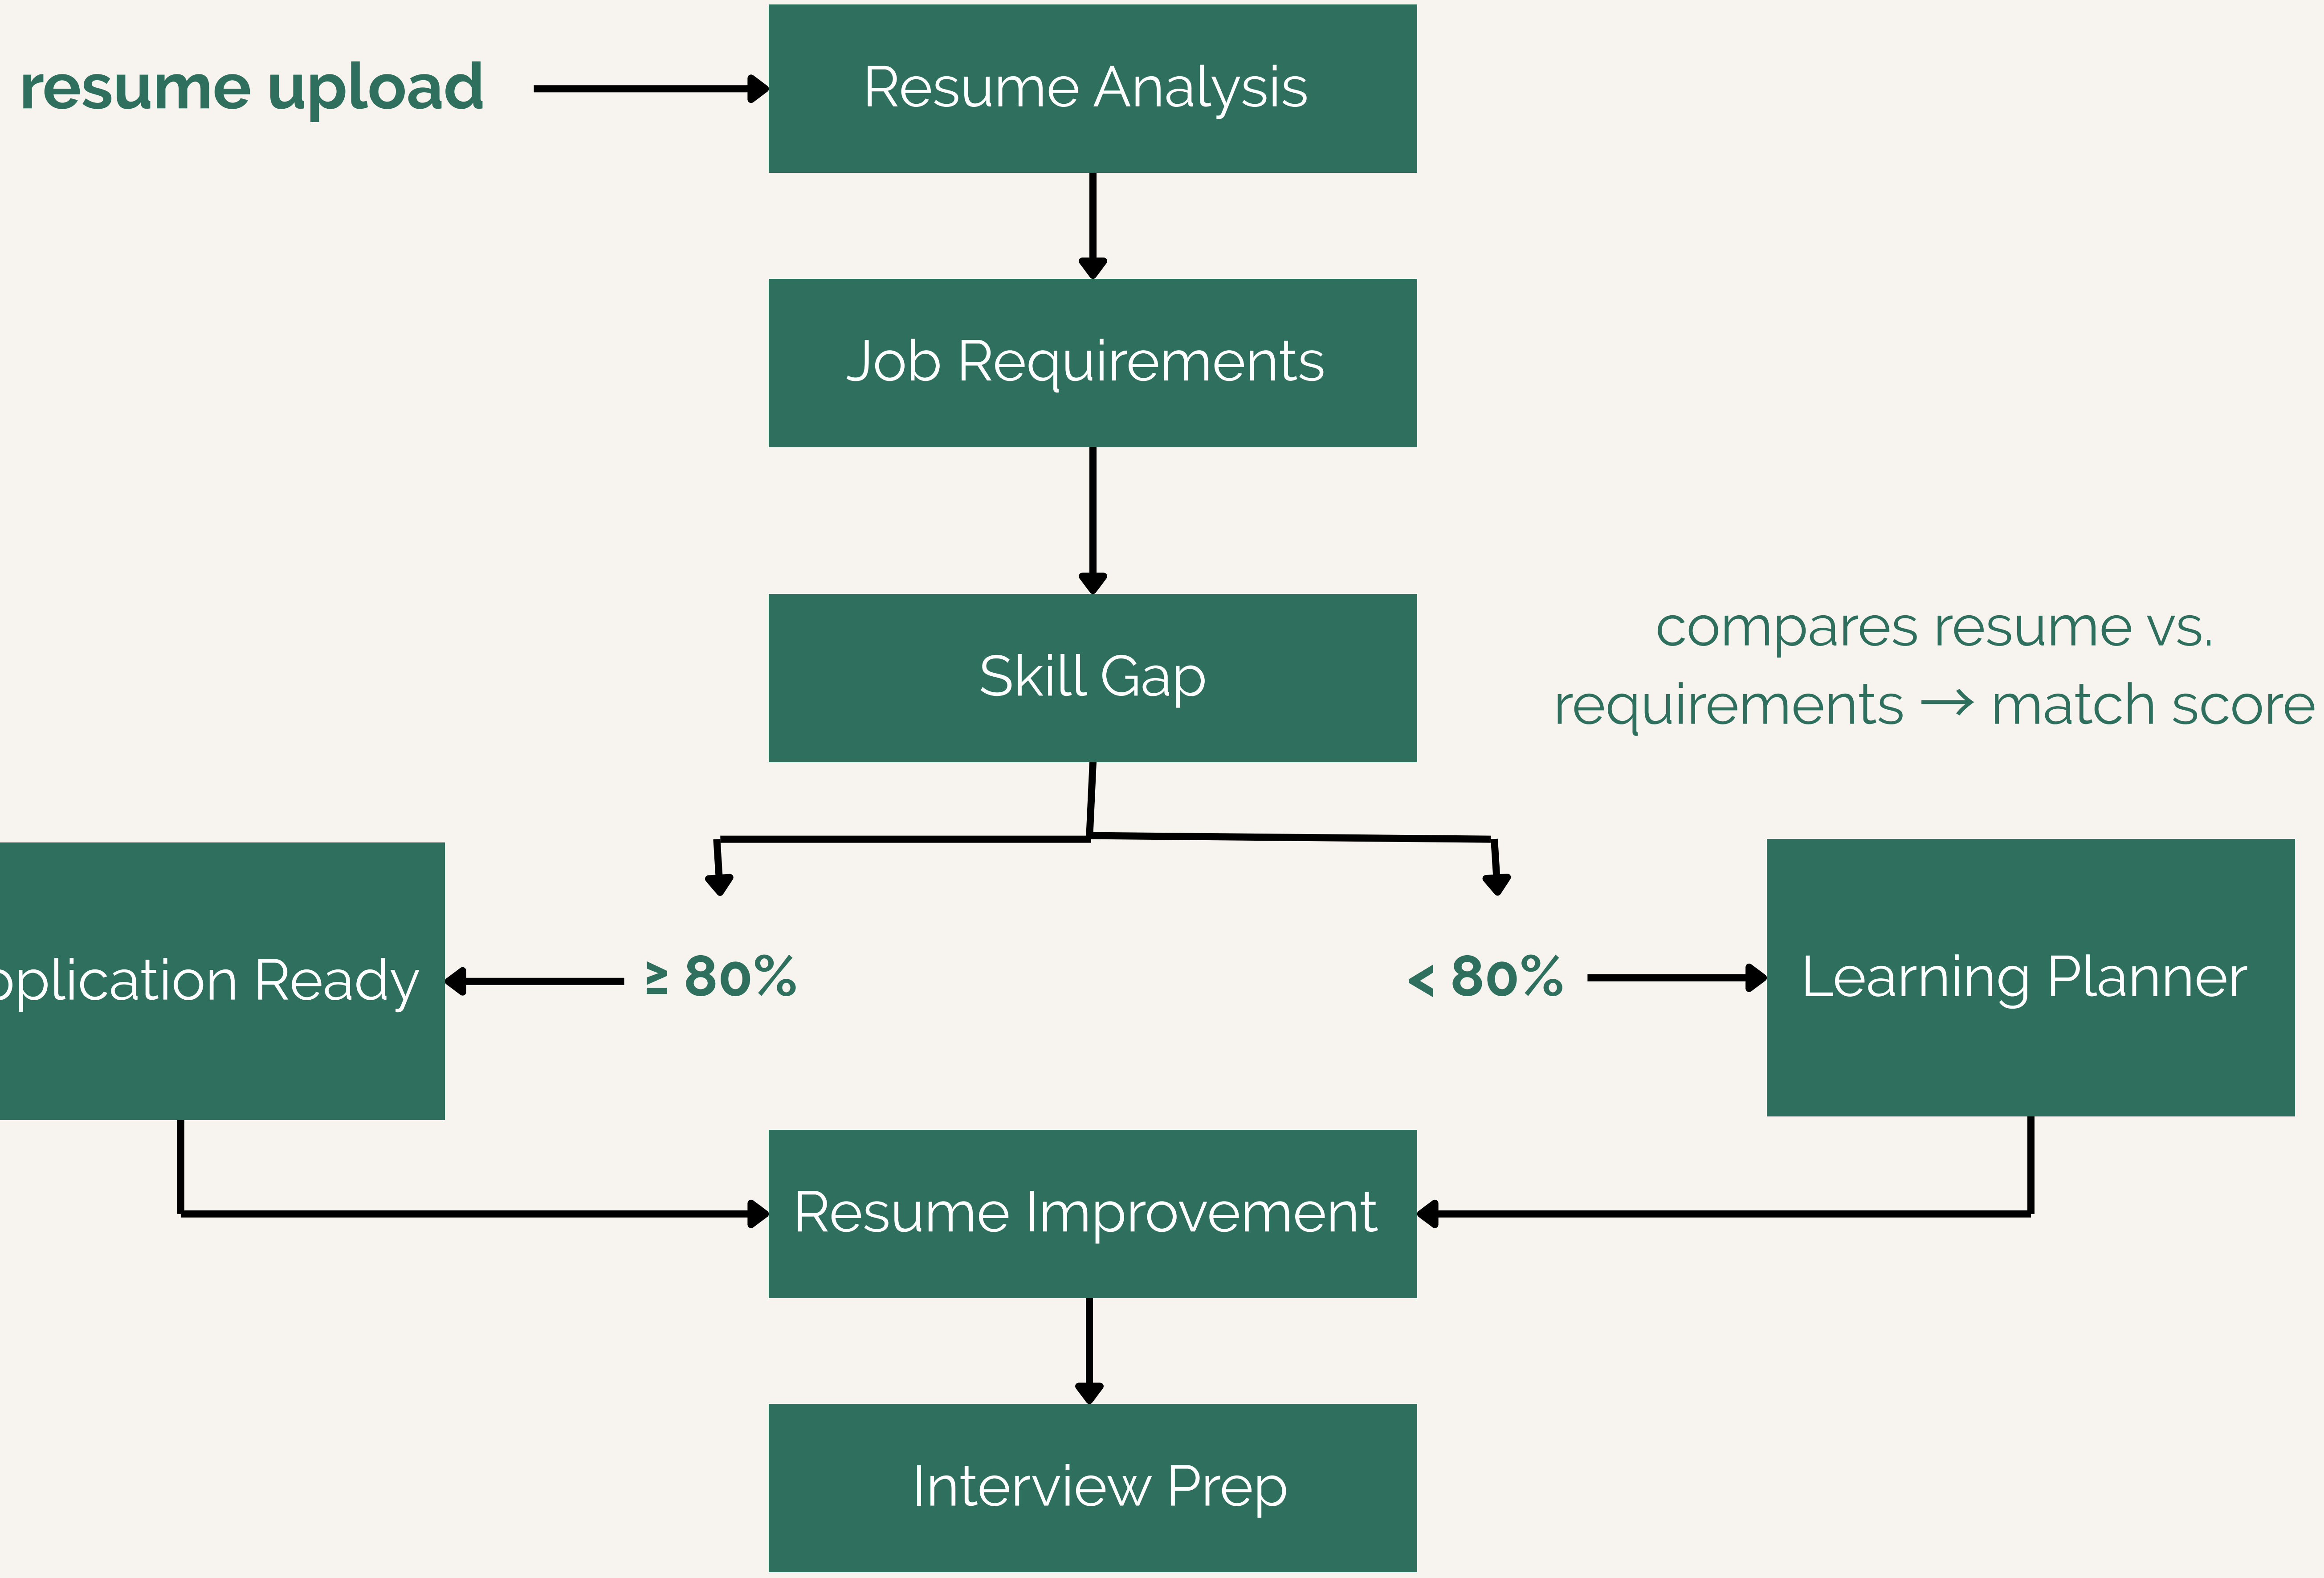
# Agents Roadmap

# Agents Roadmap





# Agents Roadmap



# Agents Roadmap

Application Ready: confirms qualification and readiness for the role (match score ≥ 80%)

Learning Planner: generates targeted skills, tasks, and time estimates to bridge the skill gap

# SECURITY & RELIABILITY CONSID

**Reliability:** If one AI step fails, we catch the error and return a safe fallback instead of crashing the whole app.

**Prompt Injection:** We prevent bad instructions hidden in a resume from taking over by forcing the AI to only output structured JSON, not free text.

**Cost Explosion:** We avoid runaway costs by running our own local AI model instead of a pay-per-use API.

**Observability:** We track what's happening by logging every AI response, so we can debug issues after the fact.

**Org Integration:** We control access with password-protected accounts and login tokens.

# SECURITY & RELIABILITY CONSID

**Data Leakage:** We protect user data by hashing passwords and giving every uploaded file a random name so files can't be overwritten or guessed.

**Evaluation:** We check accuracy with rule-based skill matching (not AI) for the one thing that must be precise: comparing skills.

**Latency:** We're aware sequential AI calls add latency and plan to run independent steps in parallel.

**Regulatory:** We limit exposure by only storing what's needed (resume data, no extra tracking) and keeping it local rather than sending it to a third party.

## Overview

Routed to: learning plan (skill gaps found)

**62.5%** match score

MISSING SKILLS

Data preprocessing and feature engineering

Model deployment and integration

Cloud platforms (AWS, GCP)

RESUME STRENGTHS

- Strong problem-solving skills
- Fast learning ability
- Passion for developing scalable, user-centered solutions

RESUME WEAKNESSES

- Limited professional experience (recent graduate)
- No industry-specific certifications
- Projects are mostly academic in nature

Overview | Learning Plan | Resume | Interview Prep

## Learning Plan

Becoming an AI Engineer — estimated 6-12 months

STEPS — TAP TO EXPAND

**Data preprocessing and feature engineering** 2-3 months ▶

**Model deployment and integration** 2-3 months ▼

Critical for deploying models into production environments, ensuring they can be used by other systems or services.

- Study frameworks like Flask or FastAPI for building web APIs
- Learn Docker basics to containerize applications
- Explore CI/CD pipelines using tools like Jenkins or GitLab CI

**Cloud platforms (AWS, GCP)** 2-3 months ▶

SUGGESTED PROJECTS

- Data preprocessing pipeline: Build a pipeline to clean, transform, and prepare data for

BULLET POINT IMPROVEMENTS — TAP TO COMPARE

**Led laboratory sessions for Computer Organization, where I guided students through the implementation of assembly language programs and explored low-level system concepts.** experience ▼

**Original:** Led laboratory sessions for Computer Organization, covering assembly language programming and low-level system concepts.

**Conducted hands-on practical sessions for Data Structures, focusing on the implementation of algorithms, critical thinking, and effective problem-solving.** experience ▶

**Developed comprehensive lab materials, exercises, and practical assessments to enhance student learning outcomes** experience ▶

## Interview Prep

TECHNICAL — TAP TO REVEAL ANSWER

**Can you explain the process of data preprocessing and feature engineering in machine learning? How would you approach these tasks for a real-world dataset?** ▼

Candidate should describe steps like handling missing values, normalization, encoding categorical variables, and selecting relevant features. They should also discuss techniques such as PCA or feature selection methods.

**What are the key considerations when deploying machine learning models in production? How do you ensure model performance and reliability?** ▶

**How would you integrate a machine learning model into an existing RESTful API? What are the best practices for this integration?** ▶

**Can you describe your experience with cloud platforms such as AWS or GCP? How would you leverage these services for an AI project?** ▶
